Using GitHub for SHM 377

We will use GitHub throughout SHM 377 to access **lecture materials, datasets, and other course resources**.

GitHub contains several different file types, including the source files used to build the course materials. **You do not need to understand or interact with the source code to use the repository.**

What You Will Learn

By the end of this guide, you should be able to:

1. Find the SHM 377 GitHub repository.
2. Navigate to the correct week and lecture.
3. Download an HTML lecture.
4. Download a CSV dataset.
5. Move the CSV dataset into your SHM 377 course folder.
6. Find the dataset using the RStudio Files pane.

Start Here

Open my GitHub profile:

[Yoni Rodriguez | GitHub](https://github.com/yoni-rodriguez)

You may want to keep GitHub open in a separate browser tab while following this guide.

Step 1: Go to My GitHub Profile

Go to my GitHub profile:

<https://github.com/yoni-rodriguez>

Once you are on my profile, select **Repositories**.

You will see the repositories containing my course materials.

For this course, select:

shm-377-hazardous-materials-management

Step 2: Open the Lectures Folder

Inside the SHM 377 repository, select the **lectures** folder.

This folder contains the lecture and lab materials that we will use throughout the quarter.

Step 3: Select the Appropriate Week

The course materials are organized by week.

For example, for Week 1 select:

week-01

Within each week, individual lectures and activities are organized into their own folders.

Step 4: Open the Appropriate Lecture Folder

For our R introduction, select:

01-R-introduction

Inside the folder, you will see several files associated with the lecture and lab.

Which Files Do I Need?

For students, the most important file types are:

File Type	What It Is	What You Will Use It For
.html	Interactive course material	Viewing lectures and labs in your web browser
.pdf	PDF course material	Saving, printing, or reviewing course materials
.csv	Dataset	Importing data into R, Excel, or another analysis program

i What About the Other Files?

You may also see **.qmd**, **.txt**, image files, and other development files. These files are primarily used to **create the course materials**. You do not need to understand or use them unless specifically instructed to do so.

Downloading an HTML Lecture

Step 5: Select the HTML File

Select the **.html** version of the lecture.

For example:

`01-R-introduction.html`

GitHub may tell you that it cannot display the HTML file directly because the file is too large.

That is okay.

Select the **download icon** in the upper right corner.

Your browser will download the HTML file to your computer.

Once the file has downloaded, open it from your browser's downloads or your computer's **Downloads** folder.

The HTML file should open in your web browser and display as the complete lecture rather than as source code.

HTML Files Open in Your Browser

An `.html` file is a webpage saved as a file on your computer.

When you open the downloaded file, your web browser should display the formatted lecture just like a webpage.

Downloading a CSV Dataset

Datasets require one additional step because RStudio needs to know **where the file is located on your computer**.

Step 6: Select the CSV File

For our R introduction, the dataset is:

```
winter-smoke-2019-12-27_to_2019-12-31.csv
```

Select the CSV file in GitHub.

GitHub will display a preview of the dataset. You do **not** need to copy the data from this screen.

Instead, select the **download icon** in the upper right corner.

The CSV file will download through your browser.

You should then see the downloaded file in your browser's download history.

Moving the CSV File into Your SHM 377 Folder

! This Step Is Important

Downloading the dataset does **not** automatically place it inside your SHM 377 RStudio Project.

Your browser will normally place downloaded files in your computer's **Downloads** folder. You need to move the dataset into the folder you created for SHM 377.

Step 7: Find the Downloaded CSV File

Open your computer's **Downloads** folder and locate:

```
winter-smoke-2019-12-27_to_2019-12-31.csv
```

Do not open the CSV file in Excel yet.

Instead, **move or copy the CSV file into the SHM 377 folder that you created for this course.**

For example, your folder might look something like:

```
SHM-377/  
  virtual-lab-01/  
    winter-smoke-2019-12-27_to_2019-12-31.csv  
    your-R-script.R
```

The exact folder structure may vary depending on how you organized your course folder.

The important part is that **you know where the CSV file is stored and that it is inside the folder you are using for your RStudio work.**

Finding the Dataset in RStudio

Step 8: Open Your SHM 377 RStudio Project

Open the RStudio Project that you created for SHM 377.

Look at the **Files pane** in RStudio.

The Files pane shows the files and folders contained in your current project location.

Navigate to the folder where you placed the CSV file.

You should see:

```
winter-smoke-2019-12-27_to_2019-12-31.csv
```

A Quick Check

If you can see the CSV file in the RStudio **Files pane**, you have successfully placed the dataset where RStudio can find it.

You can confirm your current working directory by running:

```
# Check the current working directory  
getwd()
```

```
[1] "C:/Users/yonir/OneDrive/Documents/CWU/courses/shm-377-hazardous-materials-  
management/course-resources/shm-377-github-guide"
```

You can also see the files available in your current folder by running:

```
# List the files in the current working directory
list.files()
```

```
[1] "github-guide-shm-377.html"
[2] "github-guide-shm-377.qmd"
[3] "github-guide-shm-377.rmarkdown"
[4] "github-guide-shm-377.txt"
[5] "github-repositories.jpg"
[6] "github-shm-377-files-download-icon-html.jpg"
[7] "github-shm-377-files-download-icon.jpg"
[8] "github-shm-377-files.jpg"
[9] "github-shm-377-find-downloaded-files.jpg"
[10] "github-shm-377-lectures.jpg"
[11] "github-shm-377-R-introduction.jpg"
[12] "github-shm-377-weeks.jpg"
```

If the CSV filename appears when you run `list.files()`, you are in the correct location.

The SHM 377 Workflow

One of the goals of SHM 377 is learning how to work with real environmental and occupational health data.

Our basic workflow will be:

```
GitHub
  ↓
Download dataset
  ↓
Move dataset into your SHM 377 folder
  ↓
Open your RStudio Project
  ↓
Locate the dataset in the Files pane
  ↓
Import and analyze the data
```

Keeping your files organized now will make the later labs much easier.

Quick Reference

File	What Should I Do With It?
HTML	Download it and open it in your web browser
PDF	Download it for viewing, saving, or printing
CSV	Download it and move it into your SHM 377 working folder
QMD	You generally do not need this file
TXT	You generally do not need this file

! Remember

You do not need to learn GitHub programming or Git commands for this course.

For SHM 377, GitHub is primarily where you will access **course materials and datasets**.

For datasets, remember:

Download → Move to your SHM 377 folder → Find it in RStudio → Analyze

Need Help?

If you have trouble finding or downloading a file after following these steps, please let me know.
